7.	Conclusion	17

Problem Statement:

Develop a Web based client-server application for maintaining the inventory management. It accepts item detail and issue the same by checking all validations. System should have authentication.

Problem Analysis

The project follows MVC Architecture.

The project mainly consist of 6 steps:

1. Registration
2. Login
3. Adding Items in List
4. Deleting Items if Required
5. Calculating total amount
6. Confirming Order

Problem Analysis

Initially on registration the data is stored in SQL in a table named 'register'.

On Login the given username and password is authenticated with the database using the **Post Method** and on success the request is forwarded using **forward(request,response)** to admin-page.html. In the navigator area there are 3 actions each being forwarded to there respective pages.

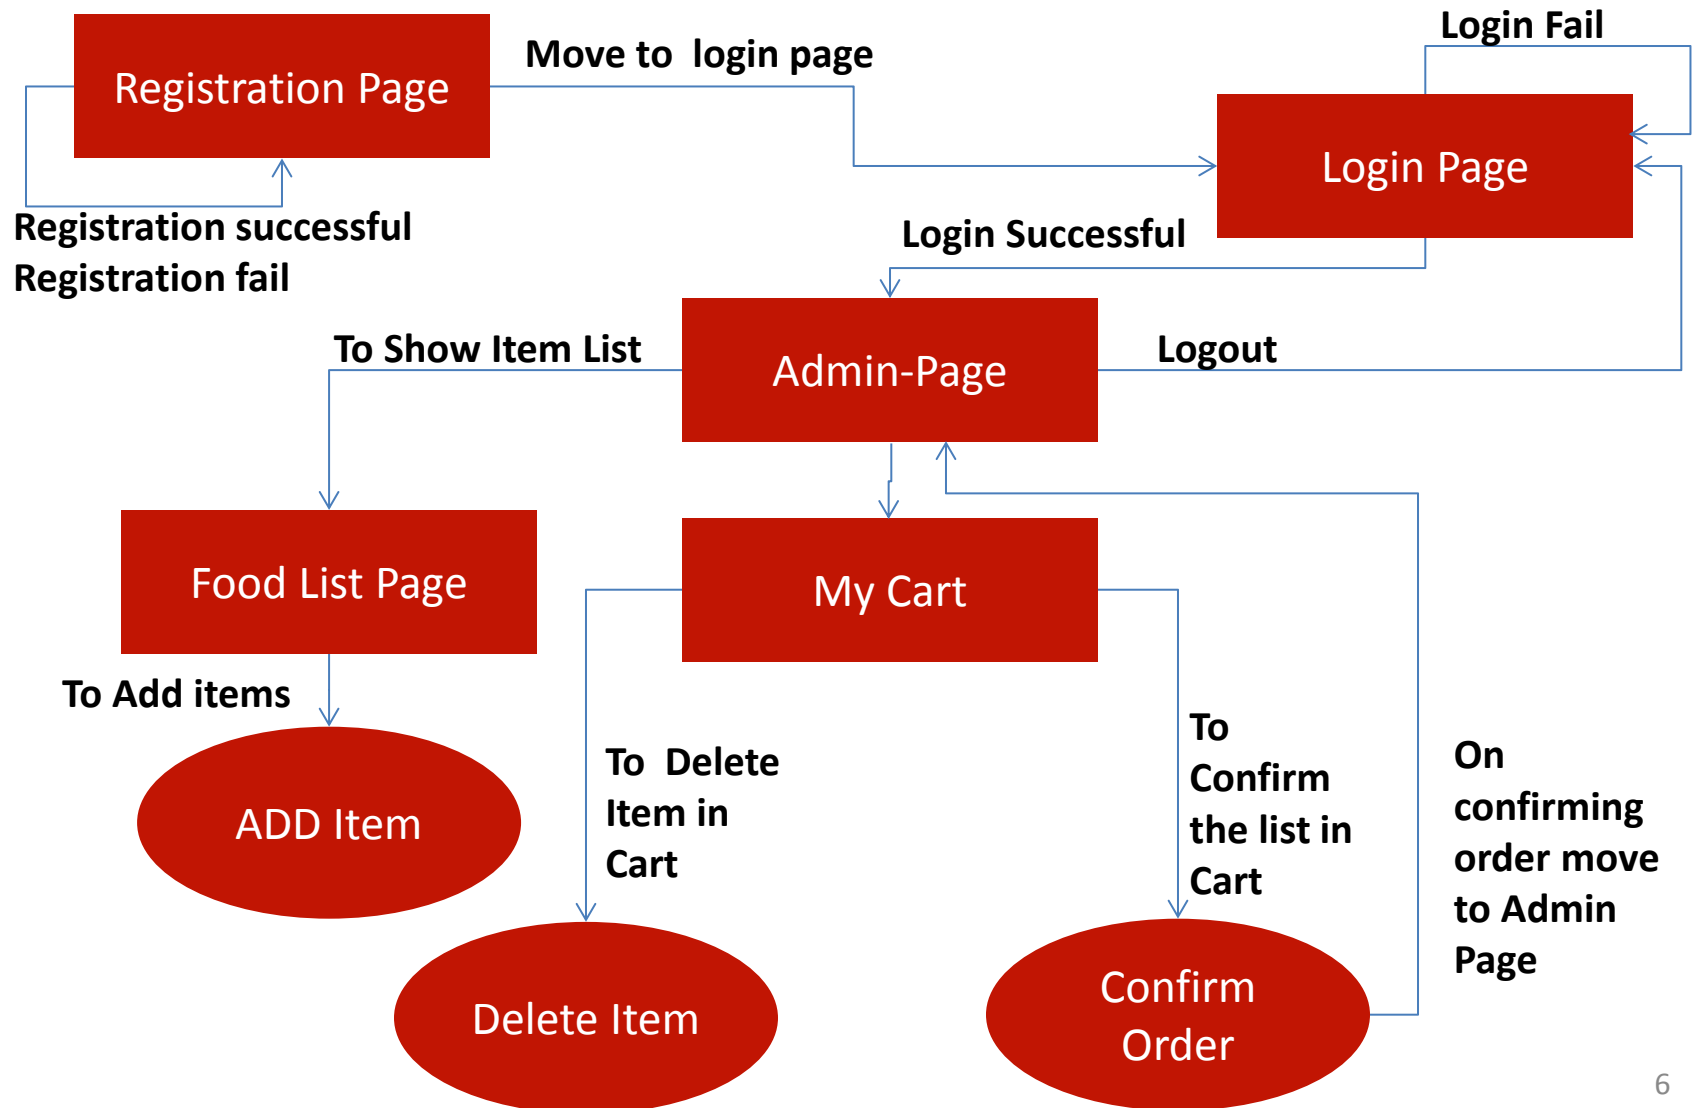

On adding items from the Item List , the price , name of item is stored in another database 'cart' and the request is included using **include(request,response)** to the same page.

The Cart option shows the selected items. Each Row has its delete option. On clicking in delete option using the **Get Method** the id is sent to the Dao.delete() and particular data is deleted.

Then the order is confirmed and the page is **Redirected to** admin-pge.html.

Using session-config we set the timeout value as 15 sec in the xml file.

Flow Chart

Step 3: On Successful Login the Welcome page opens

Step 4: Food Menu List opens and then Add the items to order.

The screenshot shows a web browser window with the address bar displaying `localhost:8080/food/Itemlist?`. The page has a red header bar. On the left, there is a sidebar with a user profile icon and three menu items: "Food Menu" (highlighted with a red underline), "Cart", and "Logout". The main content area is titled "ORDER FOOD" and contains a table with the following data:

SL	Name	Price	Add
1	Chicken biryani	180	Add
2	Chicken Chap	150	Add
3	Gulab Jamun	50	Add
4	Crispy Corn	120	Add
5	Paneer kabab	200	Add
6	IceCream	80	Add
7	Jeera Rice	120	Add
8	Mutton Biryani	200	Add
9	Mutton Kasha	200	Add

Step 5: Open the Cart to view the added items.

MY CART

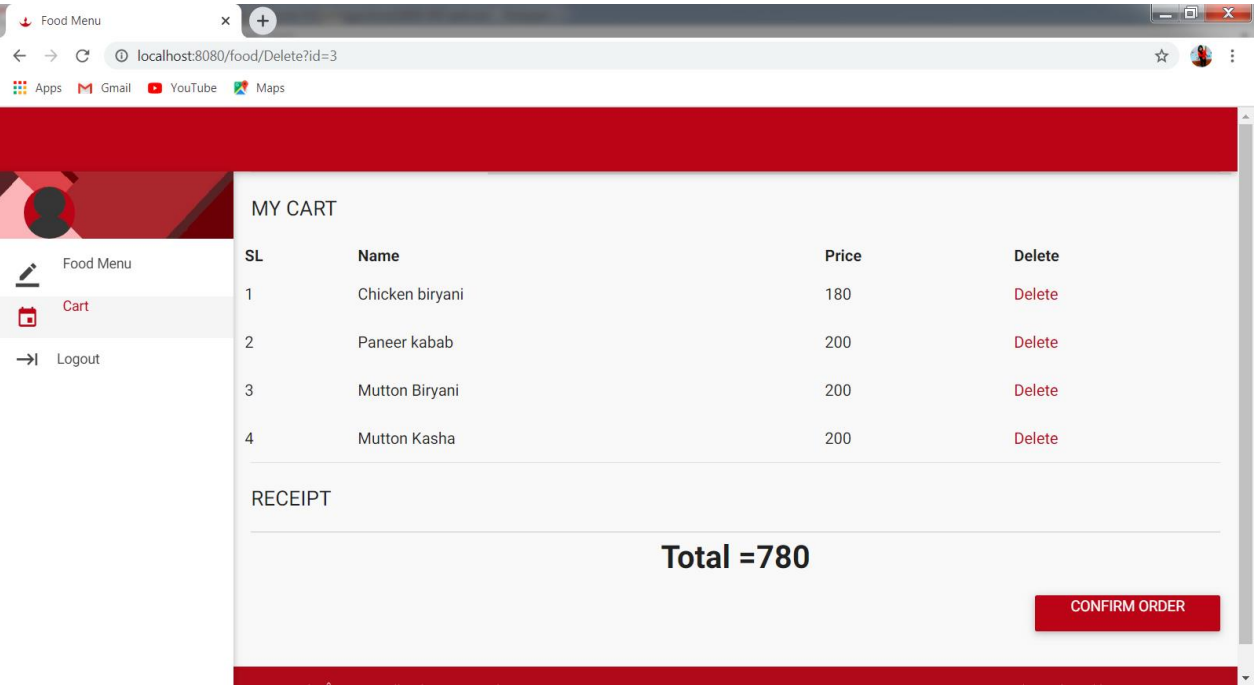

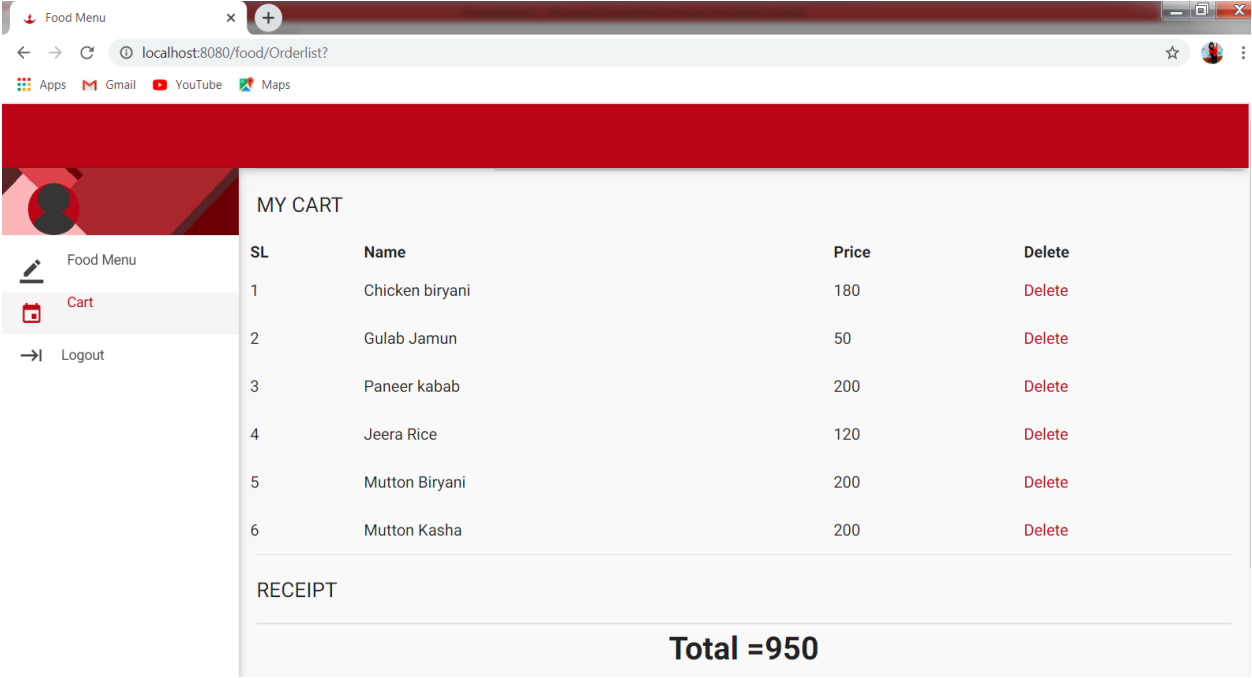

SL	Name	Price	Delete
1	Chicken biryani	180	Delete
2	Chicken Chap	150	Delete
3	IceCream	80	Delete
4	Mutton Kasha	200	Delete

RECEIPT

Total =610

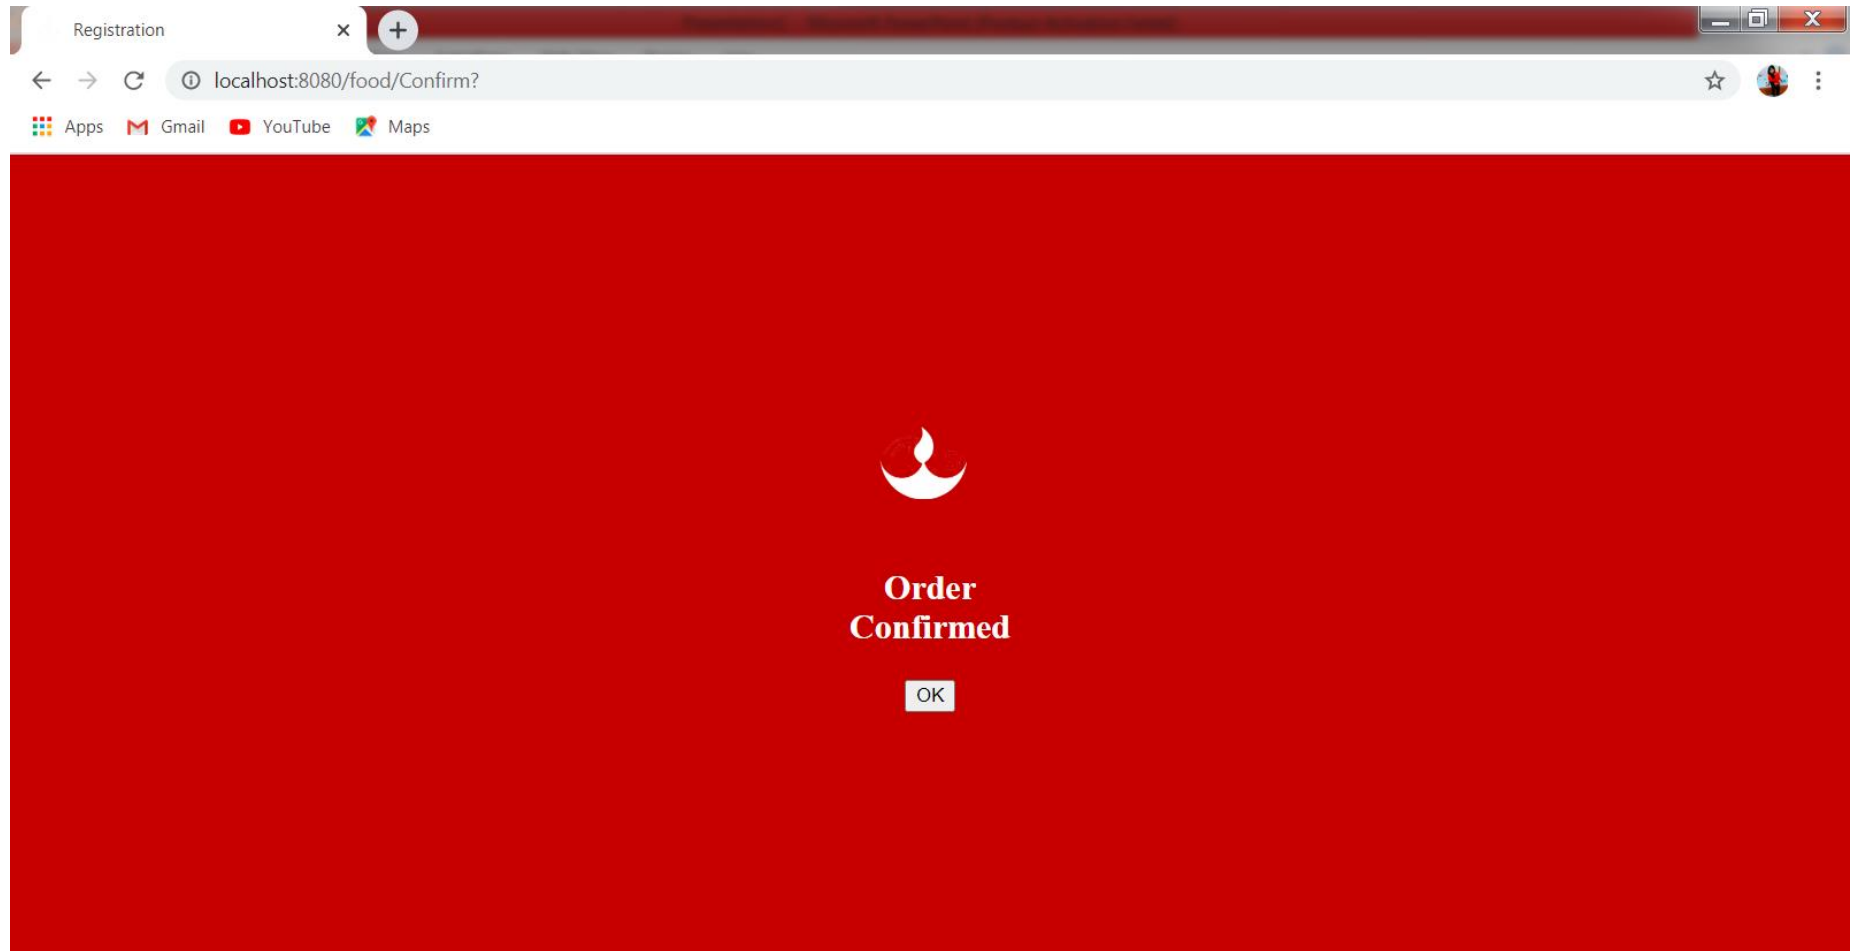

CONFIRM ORDER

Step 6: Click on Delete option to delete the particular item.

Before and After Snap of Deletion

Step 6: Click on the Confirm Order in MyCart page to confirm the order.

Conclusion:

- Using Html, CSS, JavaScript and Java Servlet we can easily design website.

Advantages of this architecture i.e. MVC:

- Easy code maintenance and easy to extend
- MVC Model component can be tested separately from the user
- It helps you to avoid complexity by dividing an application into the three units. Model, view, and controller
- All classed and objects are independent of each other so that you can test them separately.
- MVC allows logical grouping of related actions on a controller together.

Disadvantages:

- The framework navigation can some time complex as it introduces new layers of abstraction which requires users to adapt to the decomposition criteria of MVC.
- No formal validation support
- Increased complexity and Inefficiency of data
- The difficulty of using MVC with the modern user interface .
